Only $149.95

Memory Board for Atari 600XL

If you're serious about computing, you can now expand your Atari 600XL computer with MicroRam 64K, the advanced design memory board from Microbits Peripheral Products.

MicroRam 64K gives you a full 64K of memory. Now, your Atari 600XL will be able to run powerful disk software. You can also run any of the software that's used on the 800XL. And the added memory not only allows you to expand your computer system to run powerful peripherals, it lets you expand your horizons when working with software such as Visicalc™, or Atari Writer™ by allowing a larger work space.

MicroRam memory board features low power, high speed 64K chips in its state of the art design. Installation is easy because no internal modification is necessary on your computer. MicroRam memory boards are housed in a sturdy case which plugs directly onto your Atari 600XL expansion bus.

You can rely on Microbits Peripheral Products for high quality peripherals for your Atari computer. MicroRam memory boards have gold card edge connectors. Reliability is further ensured by thoroughly testing and cycling each board.
